# Designing Trusted AI- Based Systems

# RELIABLE

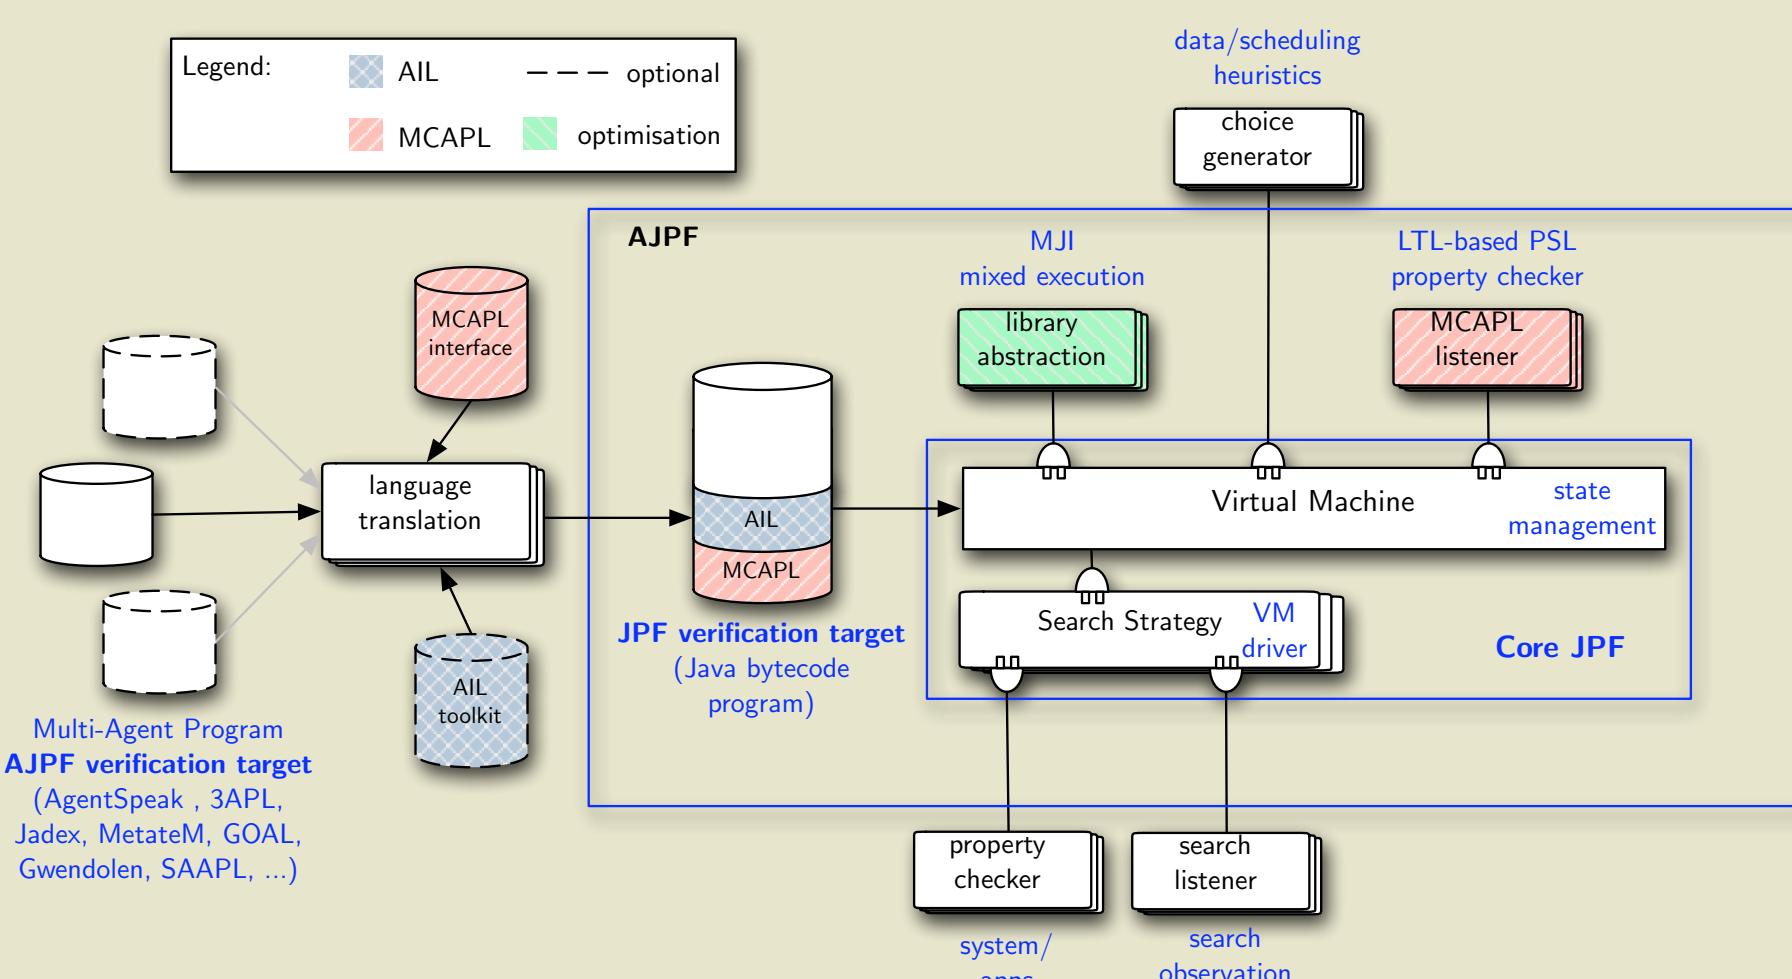

Accuracy

Efficiency

Availability

Explainability

Predictability

- Mechanisms of introducing bias into datasets and algorithms:
  - **Automatic:** Training on non-representative or otherwise inherently biased data
  - **Unintentional:** insufficiently diverse team/methods/expertise increase the chance of bias introduced by ignorance.
  - **Deliberate:** biased or fake data introduced in any phase of design, implementation, or at runtime.

- Can bias be qualified and quantified?

# PRIVACY BY DESIGN

Including privacy as a requirement in the design and development process.

- Encryption
- Federated Learning
- Differential Privacy
- Access Control
- Transparency
- Consent

- Data protection by design and default
- **At a glance**
- The GDPR requires you to put in place appropriate technical and organisational measures to implement the data protection principles and safeguard individual rights. This is 'data protection by design and by default'.
- In essence, this means you have to integrate or 'bake in' data protection into your processing activities and business practices, from the design stage right through the lifecycle.
- This concept is not new. Previously known as 'privacy by design', it has always been part of data protection law. The key change with the GDPR is that it is now a legal requirement.
- Data protection by design is about considering data protection and privacy issues upfront in everything you do. It can help you ensure that you comply with the GDPR's fundamental principles and requirements, and forms part of the focus on accountability.

# PRIVACY BY DESIGN

## Checklists

- We consider **data protection issues as part of the design and implementation** of systems, services, products and business practices.
- We make data protection an **essential component of the core functionality** of our processing systems and services.
- We **anticipate risks** and privacy-invasive events before they occur, and take steps to prevent harm to individuals.
- We **only process** the personal **data that we need** for our purposes(s), and that we only use the data for those purposes.
- We ensure that personal **data is automatically protected** in any IT system, service, product, and/or business practice, so that individuals should not have to take any specific action to protect their privacy.
- We provide the **identity and contact information of those responsible for data protection** both within our organisation and to individuals.

- We adopt a '**plain language**' policy for any public documents so that individuals easily understand what we are doing with their personal data.
- We **provide** individuals with **tools** so they can **determine how we are using their personal data**, and whether our policies are being properly enforced.
- We offer **strong privacy defaults**, user-friendly options and controls, and respect user preferences.
- We only **use data processors that provide sufficient guarantees** of their technical and organisational measures for data protection by design.
- When we use other systems, services or products in our processing activities, we make sure that we **only use those whose designers and manufacturers take data protection issues into account**.
- We use **privacy-enhancing technologies (PETs)** to assist us in complying with our data protection by design obligations.

# UTILITARIANISM

The right actions are the one that increase the utility in society.

Jeremy Bentham (1748-1832) and John Stuart Mill (1806-1873)

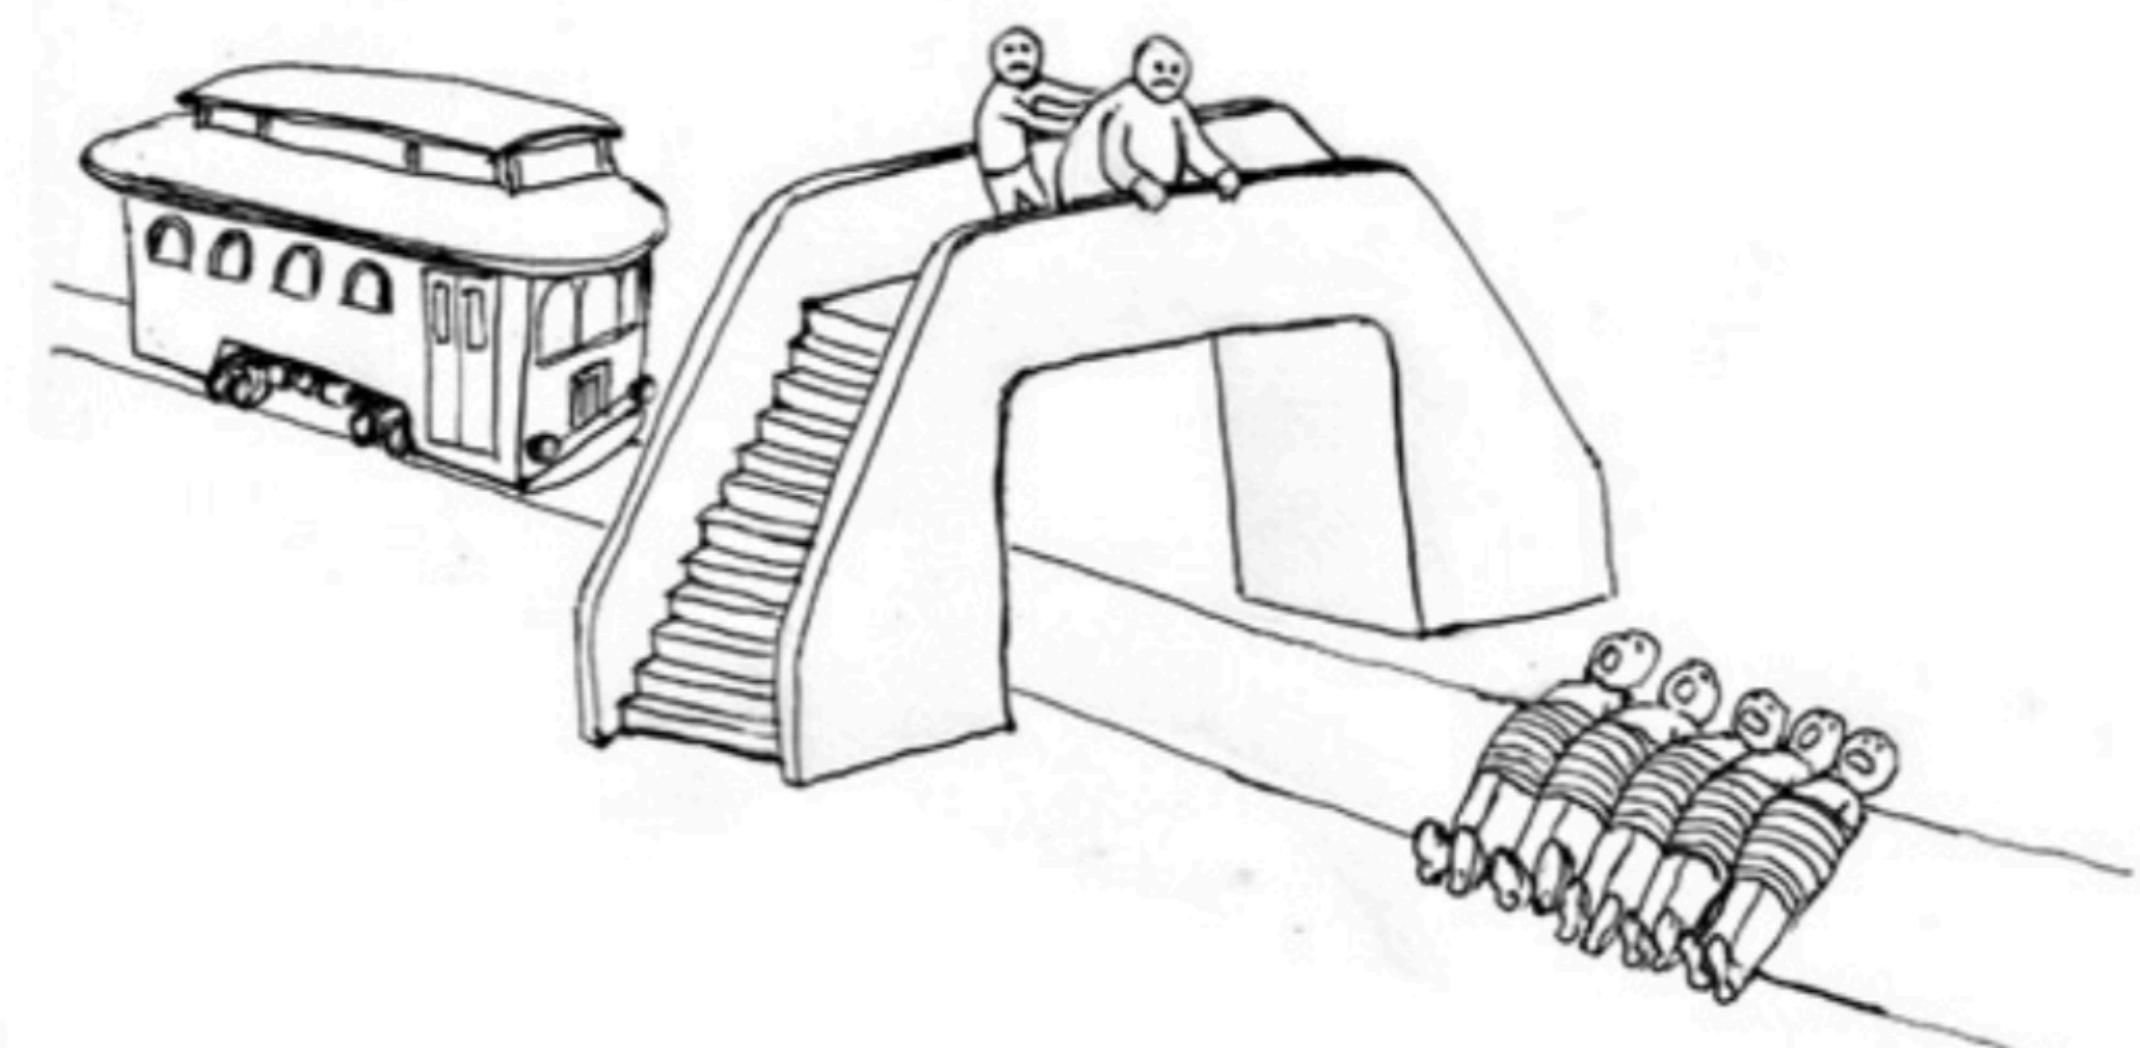

## Act-Utilitarianism

Acting driven by utilitarianism:

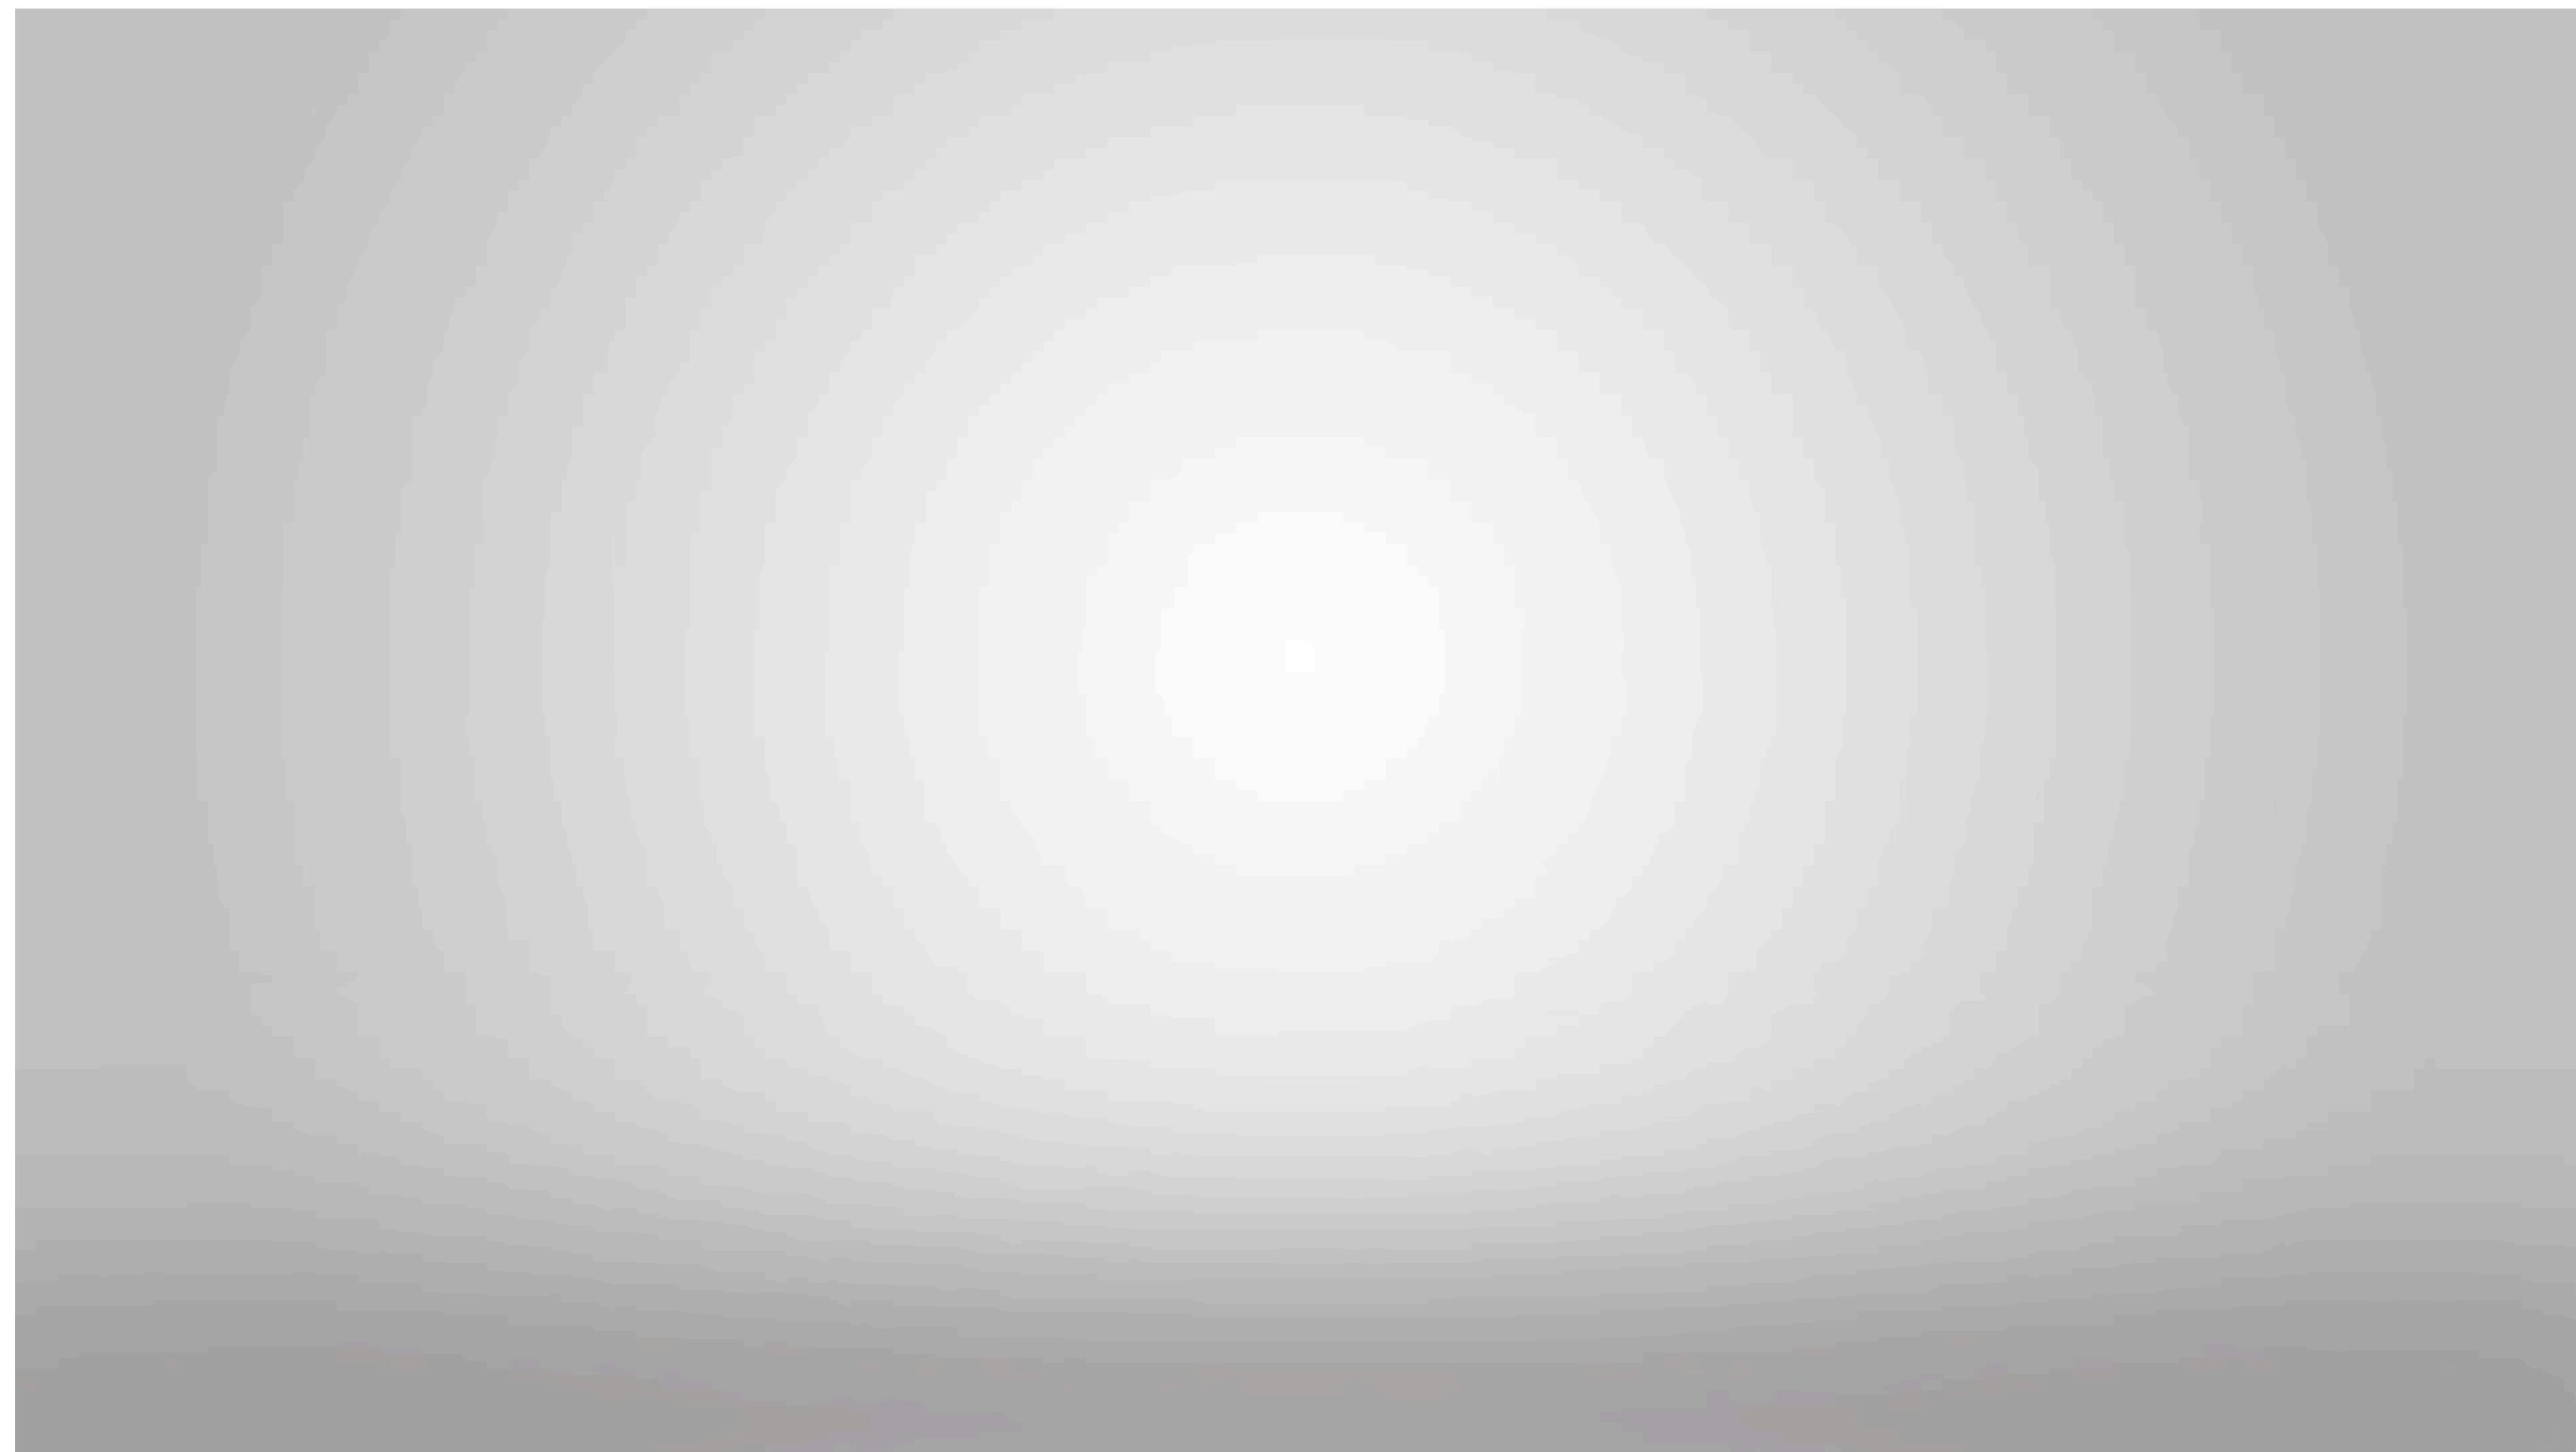

Morally correct actions are those that directly produce the greatest overall good, everyone considered

## Rule-utilitarianism

Morally correct action is the one covered by a rule that if generally followed would produce the most favourable balance between good and evil, everyone considered (rules must be followed constantly even if they are locally not the best choice)
